What is bee venom?

Bee venom is a liquid that a bee produces in its body. It is used in medicine to treat various kinds of diseases in a way of apitherapy for many years. The basic function of bee venom is to protect a bee itself and also a whole colony. Bee venom is produced by young bees until the 18th day of life. After it is produced bee venom is placed in a special bladder until the end of her life or until the attack of some predator in which case the bee delivers venom from her bladder in the amount 0,3-0,5 mg.

Bee venom is a dense liquid with a specific smell and bitter taste. It is known that bee venom is 30% more active than snake venom. However, the amount of snake venom delivered by a snake's bite is much higher (for example, one bite of a viper snake equals 350 bee bites).

BUY

APPLICATION

TRADITIONAL MEDICINE

It is used as an antirheumatic in traditional medicine. More recent studies on the use of bee venom in the treatment show that bee venom has the effect of reducing pain, lowering blood pressure, reducing blood cholesterol, and increasing work capacity.

It also protects the body against infectious diseases. It is used as a medicine for the treatment of joint inflammation, various neuralgia, and acute inflammation of the blood vessels. Treatments for bee stings are specifically described. Bee venom and the use of bee sting is an accepted part of basic medicine. Also, many small bee venom peptides (for example, peptide MCD and apamin), due to their attachment to specific cellular receptors or cell membrane protein channels, have found very important applications in physiological studies of cell membrane functions.

PHARMACEUTICAL INDUSTRY

Due to the increased use of bee venom in the pharmaceutical industry (about 75 isolated components), today it is obtained by electrical stimulation of bees.

RESEARCH

Skin

- The beneficial effects of honeybee-venom serum on facial wrinkles in humans
- Effects of cosmetics containing purified honeybee (Apis mellifera L.) venom on acne vulgaris.

Cancer

- Anti-cancer effect of bee venom toxin and melittin in ovarian cancer cells through induction of death receptors and inhibition of JAK2/STAT3 pathway
- Bee venom inhibits tumor angiogenesis and metastasis by inhibiting tyrosine phosphorylation of VEGFR-2 in LLC-tumor-bearing mice
- Bee venom in cancer therapy

Rheumatoid arthritis

- Clinical randomized study of bee-sting therapy for rheumatoid arthritis
- Bee Venom Therapy: Bee Venom, Its Nature, and Its Effect on Arthritic and Rheumatoid Conditions

Multiple sclerosis

- A randomized crossover study of bee sting therapy for multiple sclerosis
- A phase I study of the safety of honeybee venom extract as a possible treatment for patients with progressive forms of multiple sclerosis
- Bee venom attenuates neuroinflammatory events and extends survival in amyotrophic lateral sclerosis models

HIV

- Cytolytic nanoparticles attenuate HIV-1 infectivity
- Nanoparticles loaded with bee venom kill HIV

Arthritis

- Bee venom injection into an acupuncture point reduces arthritis associated edema and nociceptive responses
- An Overview of Bee Venom Acupuncture in the Treatment of Arthritis
